

Measurement and Monitoring Systems

Apply vibration analysis hands-on with our Pilot-Kit The easy way to monitor machines and systems

Vibrations reveal a lot about the condition of a machine. They can, for example, indicate obvious signs of wear at an early stage. Our sensor u-sense vibration can reliably detect abnormal vibrations of evenly running machines.

With our Pilot-Kit, you can perform vibration analysis with u-sense vibration quickly and easily on your machine. The sensor records vibration and temperature data from your machine and sends it wireless to the gateway. There the data are analysed and visualised in the user-friendly open-source development environment Node-RED. All you need is your browser.

The Pilot-Kit includes the hardware as well as the application software on the gateway for local visualisation, storage and monitoring of the measured values. The application software also offers the option of connecting to further data services (multi-connectivity).

- Test kit at a special price
- Data acquisition on your machine
- Local visualisation and monitoring
- Multi-connectivity

Central data visualisation and simple connection of your production and process equipment

Support of cloud and server solutions

**Test your application
with our Pilot-Kit
at attractive conditions**
